

DE-13 Passive sampling in Seawater					
Year	2021	Number of Rounds / Year	1	Number of Materials	3
Distribution	October (15 laboratories expected)				
Participation fee	€900,=				

Passive sampling will become an important procedure to measure concentrations of determinands, like e.g. HCB, HCBD, PCB's, PAH's and Brominated flame retardants in seawater. Therefore, a development exercise will be offered in the new proficiency testing scheme.

The development exercise will be conducted in co-operation with Foppe Smedes (Deltares/Masaryk University) and Kees Booij (NIOZ/PaSOC). Following your subscription, an inventory will be held with respect to internal standards which are used in your laboratory and may conflict with PRC's to be used within the development exercise itself.

We expect to start the development exercise in September 2021. Estimated price is € 900,=.
