## QUASIMEME

Quality assurance of information for marine environmental monitoring

## Certificate of Analysis

Halogenated Organics in seawater

REFERENCE MATERIAL
AQ5 sample 111

## Certificate of Analysis <br> AQ5 111

## General Information

In this report an overview is given of analytical data for this sample collected in our proficiency testing program. The consensus values are calculated using a robust statistical model. With this NDA model mean and standard deviation are calculated using all reported data when at least 4 results are left after removal of reported 'lower than' (<) and 0 (= zero) values. No outliers are removed.

This report is divided into two sections: Consensus Values and Indicative Values. The division is made on the reliability of the data. Consensus Values are based on at least 10 results while the relative uncertainty is smaller than $6.25 \%$. Indicative Values are based on a relative uncertainty of maximum $35 \%$ with at least 4 and less than 10 results or a relative uncertainty higher than $6.25 \%$.

For each determinand the following parameters are given: mean, standard deviation, coefficient of variation, number of results, median, MAD (Median of Absolute Deviation) and the uncertainty in the assigned value. The confidence limits (at $95 \%$ probabilty) are calculated for these determinands.

## Sample information

QUASIMEME reference materials cover a range of natural SeaWater species from contaminated waters from the North Sea and/or Mediterranean.

This AQ5 sample 111 of Seawater with spike solution from North Sea is prepared for the QUASIMEME proficiency programs. The results on which the values in this report are based were taken from the periods given in the following table.

| Year.Round | Program | Sample <br> Round Id |
| :---: | :---: | :---: |
| 2023.1 | AQ5 | QOC108SW |

Method: PCBs\&OCP - AQ5

| Method: PCBs\&OCP - AQ5 Element | Unit | Mean | Std.Dev. | CV \% | N | Median | MAD | Uncertainty | 95 \% con |  | imits |
